ICSE 2017 Grade 10

Question 3(c):

As, Here the value of n is odd.

The marks of 10 students of a class in an examination arranged in ascending order is as follows:

13, 35, 43, 46, x , $x+4$, 55, 61, 71, 80.

If the median marks is 48, find the value of x . Hence find the mode of the given data.

$$\text{Median} = \frac{(x) + (x + 4)}{2}. \quad (1)$$

$$\text{Median} = \frac{(2x + 4)}{2}. \quad (2)$$

$$\text{Median} = x + 2. \quad (3)$$

$$x = \text{Median} - 2 \quad (4)$$

$$x = 48 - 2 \quad (5)$$

$$x = 46. \quad (6)$$

Solution:

Required:

(i) value of x .

(ii) mode of the data.

Median(definition): it is the middle number in a sorted ordered list of number.

i.e., if n be the number of entries in given data then median of the data is:

Requirement (ii) : mode of the data.(Histogram)

Converting given set of sorted numbers into Class Intervals(to use Histogram method to find mode):

(i) if $n = \text{odd}$, Median = $(\frac{n}{2})^{th}$ element.

Given data :13, 35, 43, 46, 46, 50, 55, 61, 71, 80.

(ii) if $(n = \text{even})$, Median = average of $(\frac{n}{2})^{th}$ and $(\frac{n+1}{2})^{th}$ elements.

CONVERTED Class intervals and frequency table:

Class Interval	frequency
0-10	0
10-20	1
20-30	0
30-40	1
40-50	3
50-60	2
60-70	1
70-80	2

TABLE I

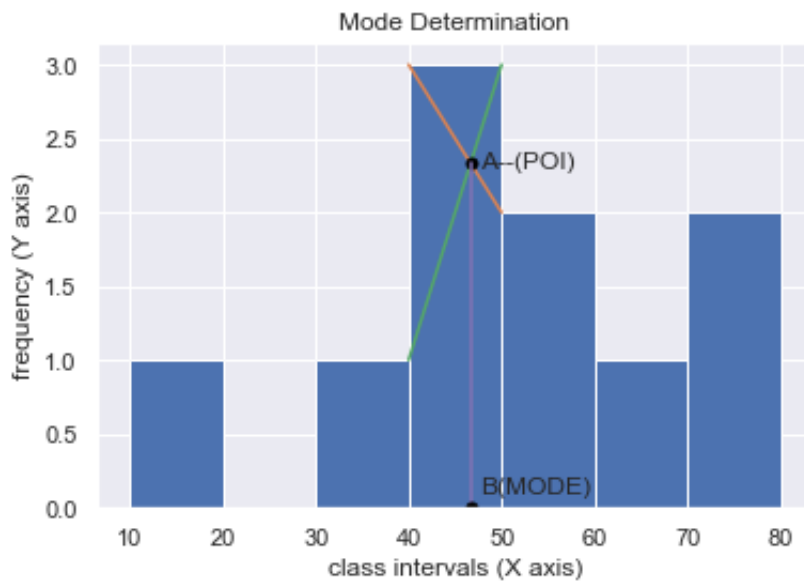

Fig. 1. Graph

Hence, Mode(approx) of given data = 46.66

i.e., **mode = 46.**
